

2024 Environmental Performance Index

Corrigendum 7 October 2024

After publishing the 2024 Environmental Performance Index (EPI) on 3 June 2024, the EPI team became aware of three small errors that impacted the results:

1. The weights assigned to the *Wastewater Collected* and *Wastewater Treated* indicators in the Water Resources category should be 1.5% each, not 2%.
2. A coding error affected the identification of performance targets for indicators based on percentiles of raw values. This error impacted the scores of five indicators in the Environmental Health policy objective: *Household solid fuels*, *NO₂ exposure*, *Lead exposure*, *Unsafe sanitation*, and *Unsafe drinking water*.
3. An error in our formula incorrectly calculated the geometric mean of the *Bioclimatic Ecosystem Resilience Index* across a country's territory.

We have now corrected these three mistakes and published updated results.

While there were minor changes in the scores and rankings of some countries in the overall EPI and some of its component categories, these corrections did not affect the main conclusions in the 2024 EPI report.
